**NOTE:** Available in standard and weathered finishes.

**PRODUCT DETAILS**

- Square Foot units are made from high-strength, low-absorption concrete on concrete block machines. Each unit covers one square foot of wall face, making Square Foot retaining walls an economical choice for large commercial and agency projects. They are routinely used by many state transportation departments.

- All VERSA-LOK retaining wall units are made to ASTM C1372 standard specifications of segmental retaining wall units.

- Sq. Foot Corner calculations are using both exposed faces of the corner stone. The minimum concave & convex radius for Square Foot units is 4’ 6”.

- Square Foot retaining walls are economically installed and mechanically fastened without mortar and do not require concrete footings. Like VERSA-LOK Standard, a pinning system is used.

**AVAILABLE COLORS**

- Antique Grey
- Bedford Brown
- Brown Flash (Limited Availability)
- Butternut
- Hickory Blend
- North Creek (Square Foot Corner and Caps Only) (Limited Availability)
- Pecan Blend (C-Cap Only) (Limited Availability)
- Raven Black
- Red Flash (Limited Availability)
UNREINFORCED WALLS
For shorter walls, Square Foot retaining walls work purely as gravity systems—unit weight alone provides resistance to earth pressures. Batter setback of wall faces offers additional resistance against overturning. Maximum allowable wall height for gravity walls varies with soil and loading conditions. Generally, with level backfill, good soils, and no excessive loading, Square Foot gravity walls are stable to heights of three feet.

REINFORCED WALLS
When weight of units alone is not enough to resist soil loads, horizontal layers of geosynthetics are used to reinforce soil behind walls. With proper soil reinforcement and design, Square Foot retaining walls can be constructed to heights in excess of 50 feet. Geosynthetics and soil combine to create reinforced soil structures that are strong and massive enough to resist forces exerted on them.
